

## Deploying ELK Stack on Docker Container

### Writeup

1. Create a yml file of the name docker-compose.yml
2. Mention the dependencies to be installed – Elastic Search, Kibana
3. Mention the server names, host port numbers.
4. Run the docker-compose command in terminal to download ELK Stack.
5. After the files are downloaded, the images and the running containers are observed in the Docker desktop.
6. Go to the port numbers in localhost and check for the working of the servers.
